

What is SPM

-----13211211 陈龙

SPM means software project management. Project is a temporary endeavor used to create a unique product and service, and this endeavor may involves many people spends thousands of hours.

SPM is a sub-discipline of project management which means manager use professional skills to plan, organize, manage the resources to reach the goals and objective. During the plan the managers need to identify the scope of project, estimate the work involved, and create a schedule. The following step is monitoring and control which can prevent from accident and can change the plan in time to make sure the project can reach the goal. The management areas involves Project Integration/ scope/time/coast/quality/human/resource/communication/risk/pr ocurement Management. So software project management is a hard work and requires many skills such as, leadership, communication, problem solving, an so on. The SPM is a complex work, every steps should be organized and controlled, a tiny mistake may cause the fail of project and huge economic loss. So a good SPM is very important, it can save

time of project and improve efficiency. If the SPM do badly the project may fail.
