March 2016

1 Introduction

SPM is software project management , a sub-discipline of project management in which software projects are planned , monitored and controlled. Project Planning's purpose are scope of the project , estimate the work involved and create a project schedule . It begins with requirements that define the software to be developed and describe the tasks that will lead to completion. Project Monitoring and Control are to keep the team and management's project's progress and help manager take action to solve problem.

2 Conclusion

If no SPM , we'll see that project fail. There are many reasons for this that lack of planning ,poor management. Finishing a project must learn to SPM, without it , there is no a successful project. For result, SPM is very import.
