

the SPM is software project management. In the SPM, the project is a temporary endeavor. Temporary is means that every project has a definite beginning and definite end. And what's the end? The end is reached when project's objectives have been achieved or it is clear that objective will not be met. The project is terminated in such a situation. However, what is the mean of PM? PM is project management. It is the discipline of planning, organizing, and managing resources to bring about the successful completion of specific project goals and objectives. So the whole mean of the software project management is a sub-discipline of project management in which software projects are planned, monitored and controlled. A bad software project management is mean that the project is Lack of planning, poor management, time-management, unclear goals, lack of testing. This is the reason why projects fail and why the SPM is so important.
